

Social care interventions that promote social participation and well-being: A mixed methods study

Dr Martin Webber, Anniversary Reader in Social Work
International Centre for Mental Health Social Research

- Interventions to enhance social networks and social participation of people with mental health problems (18-65)
- Used EPPI-Centre methodology
- 12 studies met inclusion criteria:
 - 2 RCTs, 6 quasi-experimental, 1 mixed methods, 3 qualitative
- Quality of studies was not great:
 - Risk of bias: high (2), moderate (7), low (3)
- Intervention components:
 - Asset-based approaches; peer-assisted; goal setting; social skill development; resource finding
- 8/9 quantitative studies reported positive findings on social participation; 6/9 studies reported improved well-being

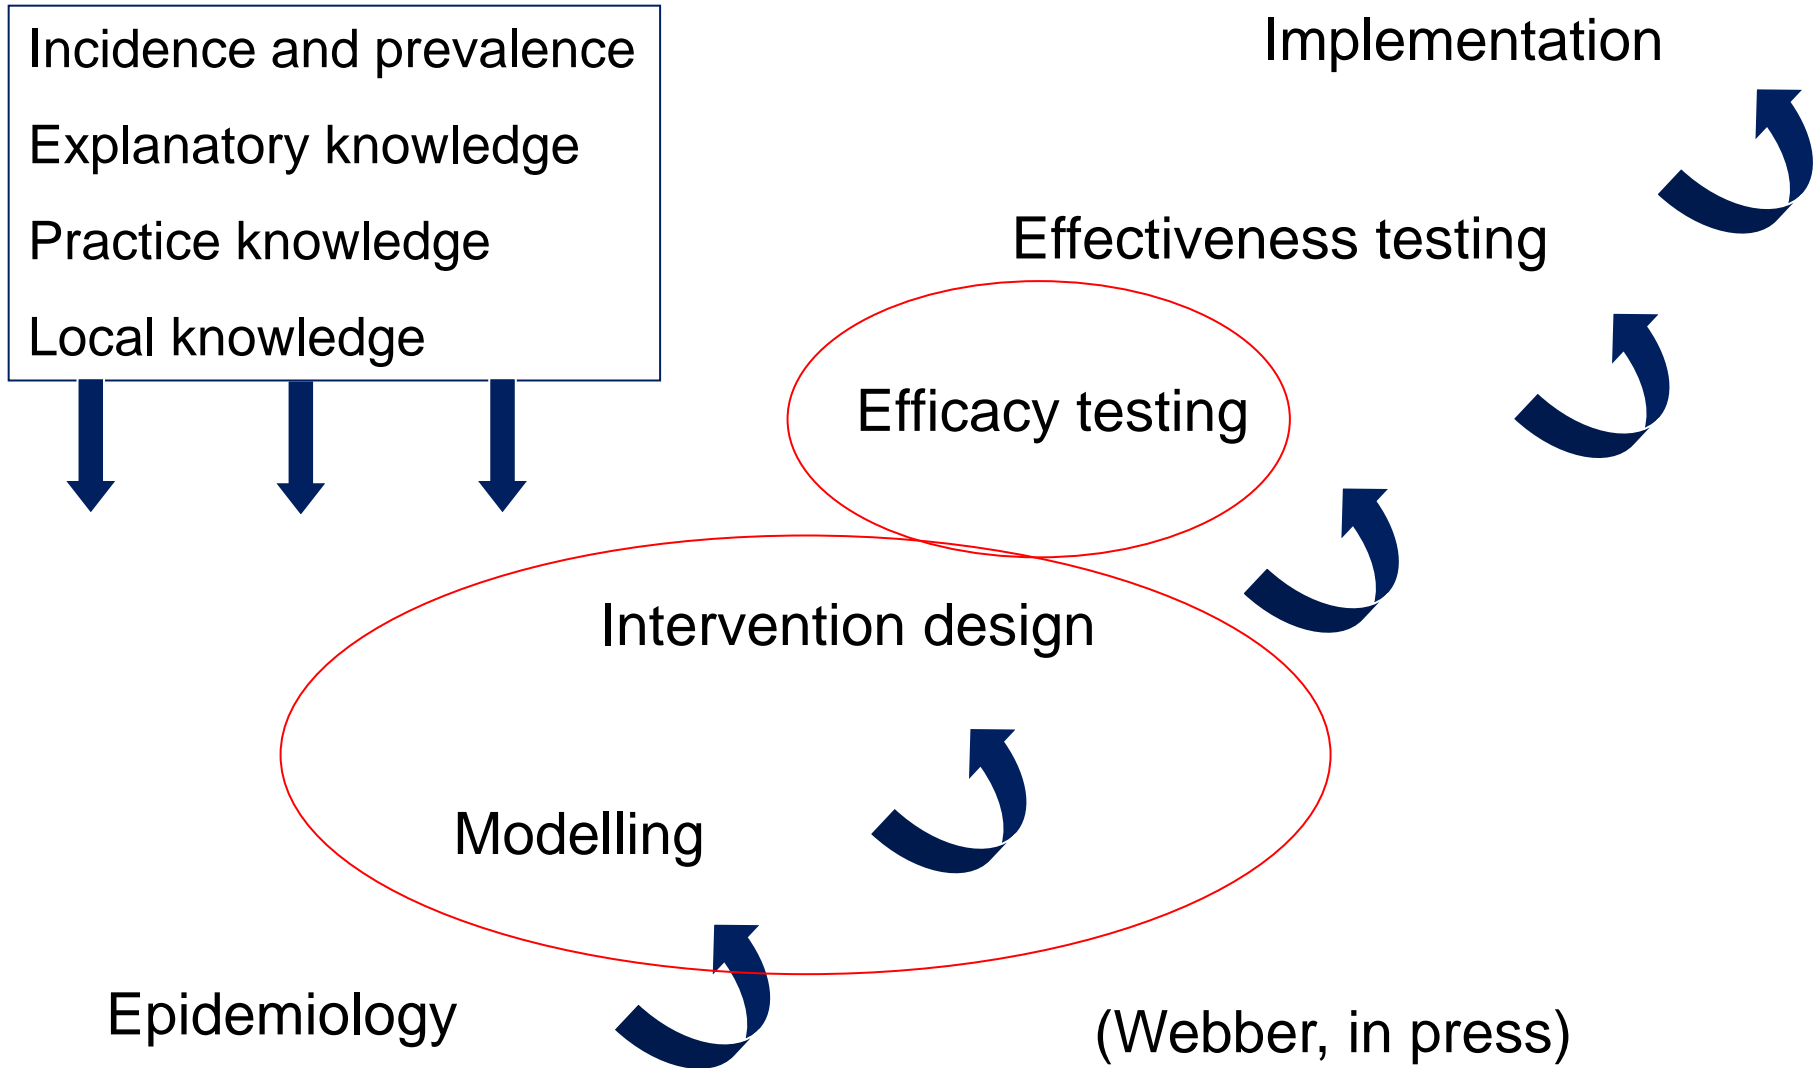

- Interventions to enhance social networks and social participation of people with mental health problems (over 65)
- Used EPPI-Centre methodology
- 6 studies met inclusion criteria:
 - 2 RCTs, 2 quasi-experimental, 2 mixed methods
- Quality of studies was not great:
 - Risk of bias: high (2), moderate (2), low (2)
- Intervention components:
 - Peer-mentoring; social skill development; person-centred planning & goal-setting; asset-based approaches; discussion groups
- 5/6 studies reported positive improvement of social participation and wellbeing

- Interventions to enhance social networks and social participation of people with learning disabilities (18-64)
- Used EPPI-Centre methodology
- 8 studies met inclusion criteria (all quasi-experimental)
- Quality of studies was not great:
 - Risk of bias: high (1), moderate (5), low (2)
- Intervention components:
 - Person-centred planning; befriending; activity scheduling; skills-based group sessions with parents; network mapping; housing
- 5/8 studies reported positive findings on social participation

Social intervention development

- To evaluate effectiveness and cost-effectiveness of the Connecting People intervention model with adults with mental health problems (below and above 65 years of age) and adults with learning disabilities
- To evaluate the implementation of the intervention model in health and social care agencies
- To gather data in preparation for an RCT

- Quasi-experimental study to pilot intervention in England
- Intervention model adapted for use with adults with learning disabilities and older adults with mental health problems
- 16 sites (10 NHS mental health trusts; 1 local authority; 5 NGOs)
- 2-day intervention training provided to each agency
- 155 new referrals being interviewed at baseline and 9-month follow-up
- Outcomes being measured:
 - Social participation (SCOPE, Huxley et al 2012)
 - Well-being (WEMWBS, Tennant et al 2007)
 - Access to social capital (RG-UK, Webber & Huxley 2007)

- Potential confounding factors:
 - Socio-demographics
 - Attachment style (RQ, Bartholomew & Horowitz 1991)
 - Life events (RLEQ, Norbeck 1984)
- Hypothesis: Higher fidelity to CPI will be associated with improved outcomes (fidelity scale developed as part of study)
- Economic evaluation:
 - Service use (CSRI, Beecham et al 2001)
 - EQ-5D (EuroQOL 1990)
 - ICECAP-A (Al-Janabi & Coast 2009)
- Process evaluation of qualitative interviews with service users, workers and managers

- Fidelity measurement is required to answer question: how do you know that the intervention made a difference and not something else?
- The Connecting People Intervention Fidelity Scale (CPIFS) measures variation in fidelity to the intervention model at an individual level (to capture expected variation in practice at the individual worker level)
- Inherently complex due to personalised nature of interventions; main focus will be on fidelity to intervention model
- Items refined in Delphi Consultation; psychometric properties evaluated in pilot study

- Parallel versions of fidelity scale for workers (CPIFS-W) and service users (CPIFS-SU)
- Five domains:
 - Engagement with service users' community
 - Assessment
 - Planning
 - Equal partnership
 - Relationships
- 3-4 questions per domain scored on a scale 1-9 (e.g. 'to what extent do you know people within your service users' community?')
- One example of practice per domain to be consensus rated

What do practitioners think about the Connecting People Intervention?

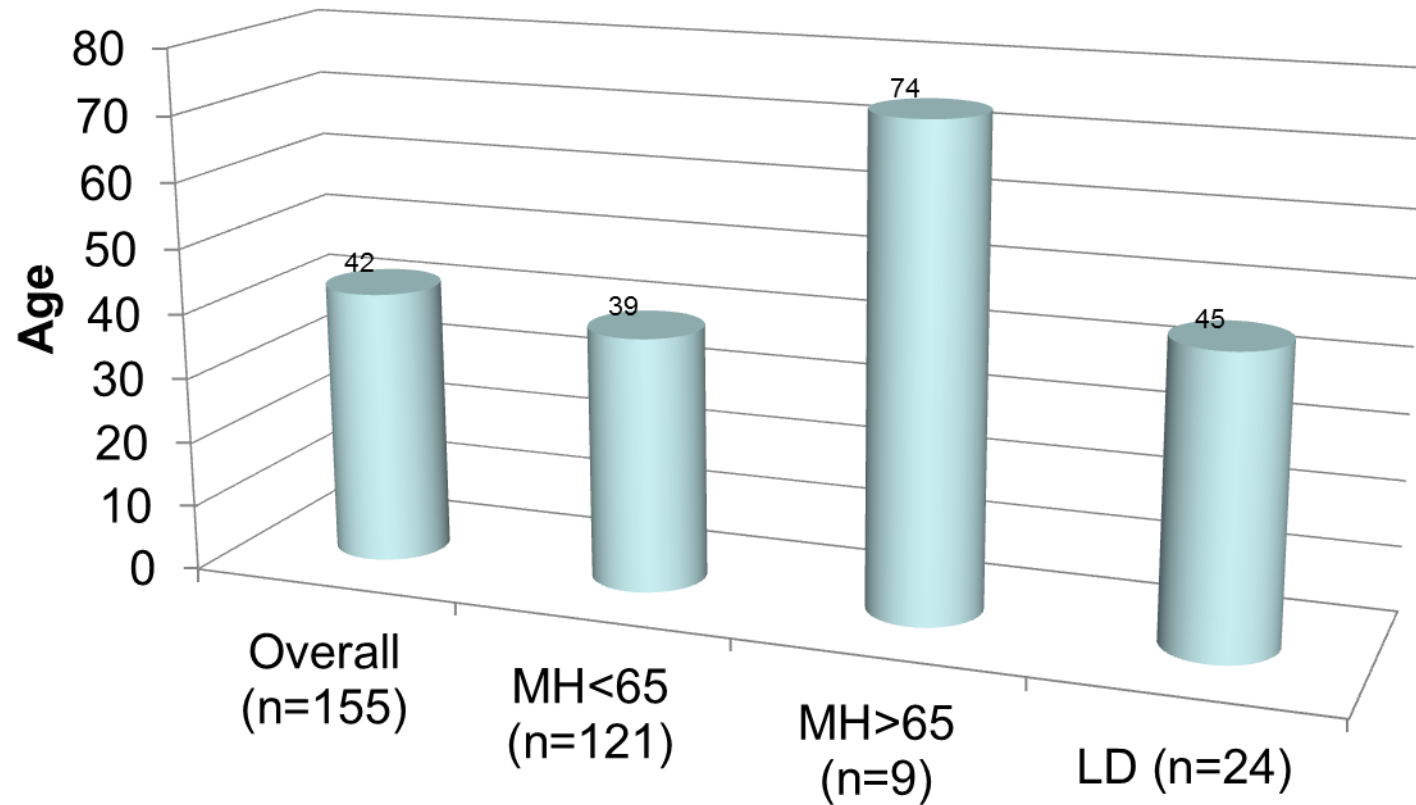

- **“We are doing this already” – model articulates practice**
 - “It’s nice to see that we’re doing a good job!”
 - “You’re not telling me anything new”
- **“There is no way we can implement this” – barriers are predominant**
 - “We cannot move away from a medical model”
 - “Our service users are too unwell, do not want to connect or do not want to change”
 - “There are no resources to implement this way of working”
- **“Let’s try something new” – open to new ideas**
 - “We’ll ask our manager to consider setting up a new drop-in”
 - “I’m going to see if x and y want to meet up”

Intervention training reflections

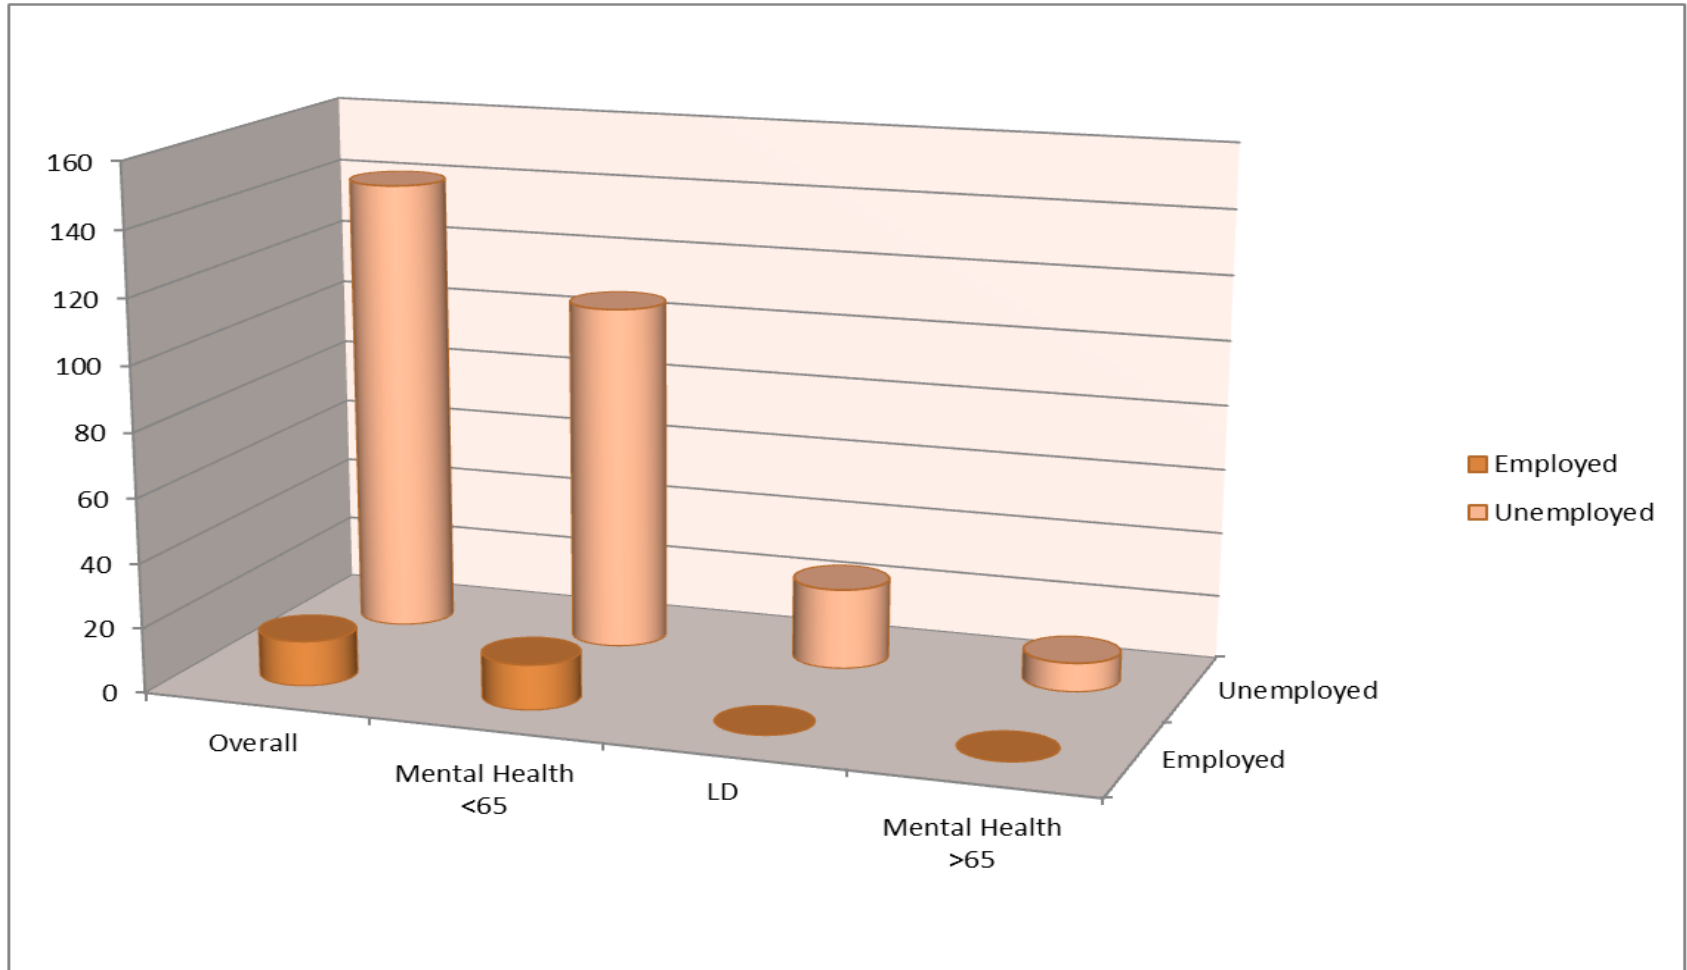

- Training was provided to a large variety of different groups:
 - Social care workers (professionally unqualified)
 - Social workers
 - Occupational therapists
 - Mental health nurses
- Experienced workers can be trained in new approaches, but:
 - Must integrate workers' expertise into the process
 - Must provide the 'big picture' and show where the training fits in
- Training needs to be engaging and fun, but relevant to practice
- Sceptical workers can be convinced of its value, unless they decide it's not for them

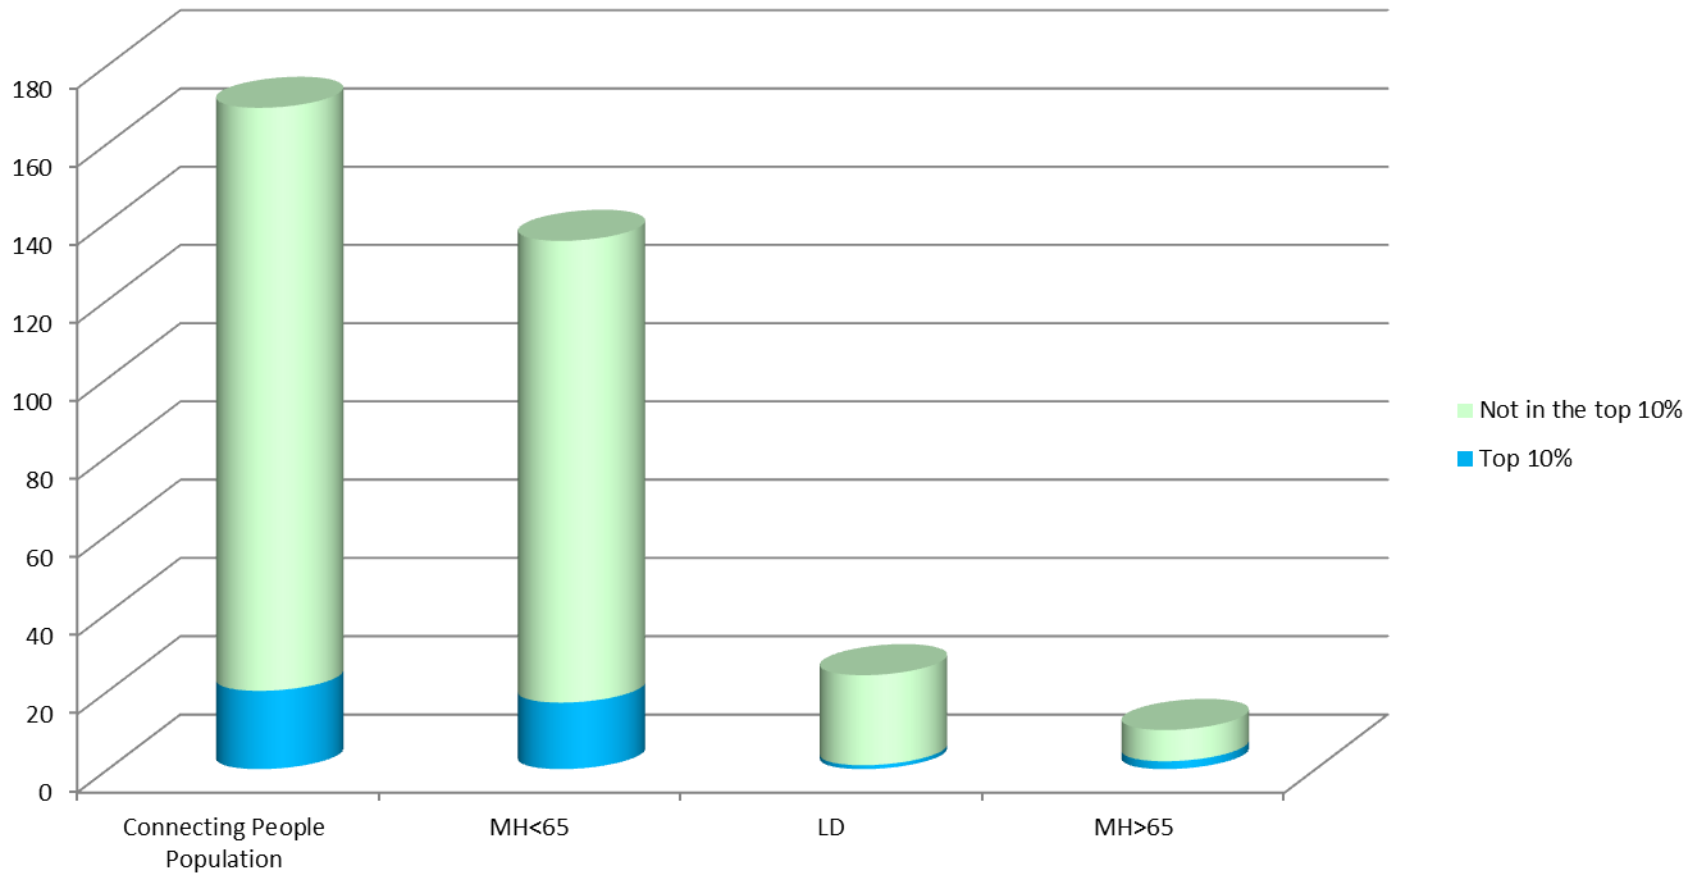

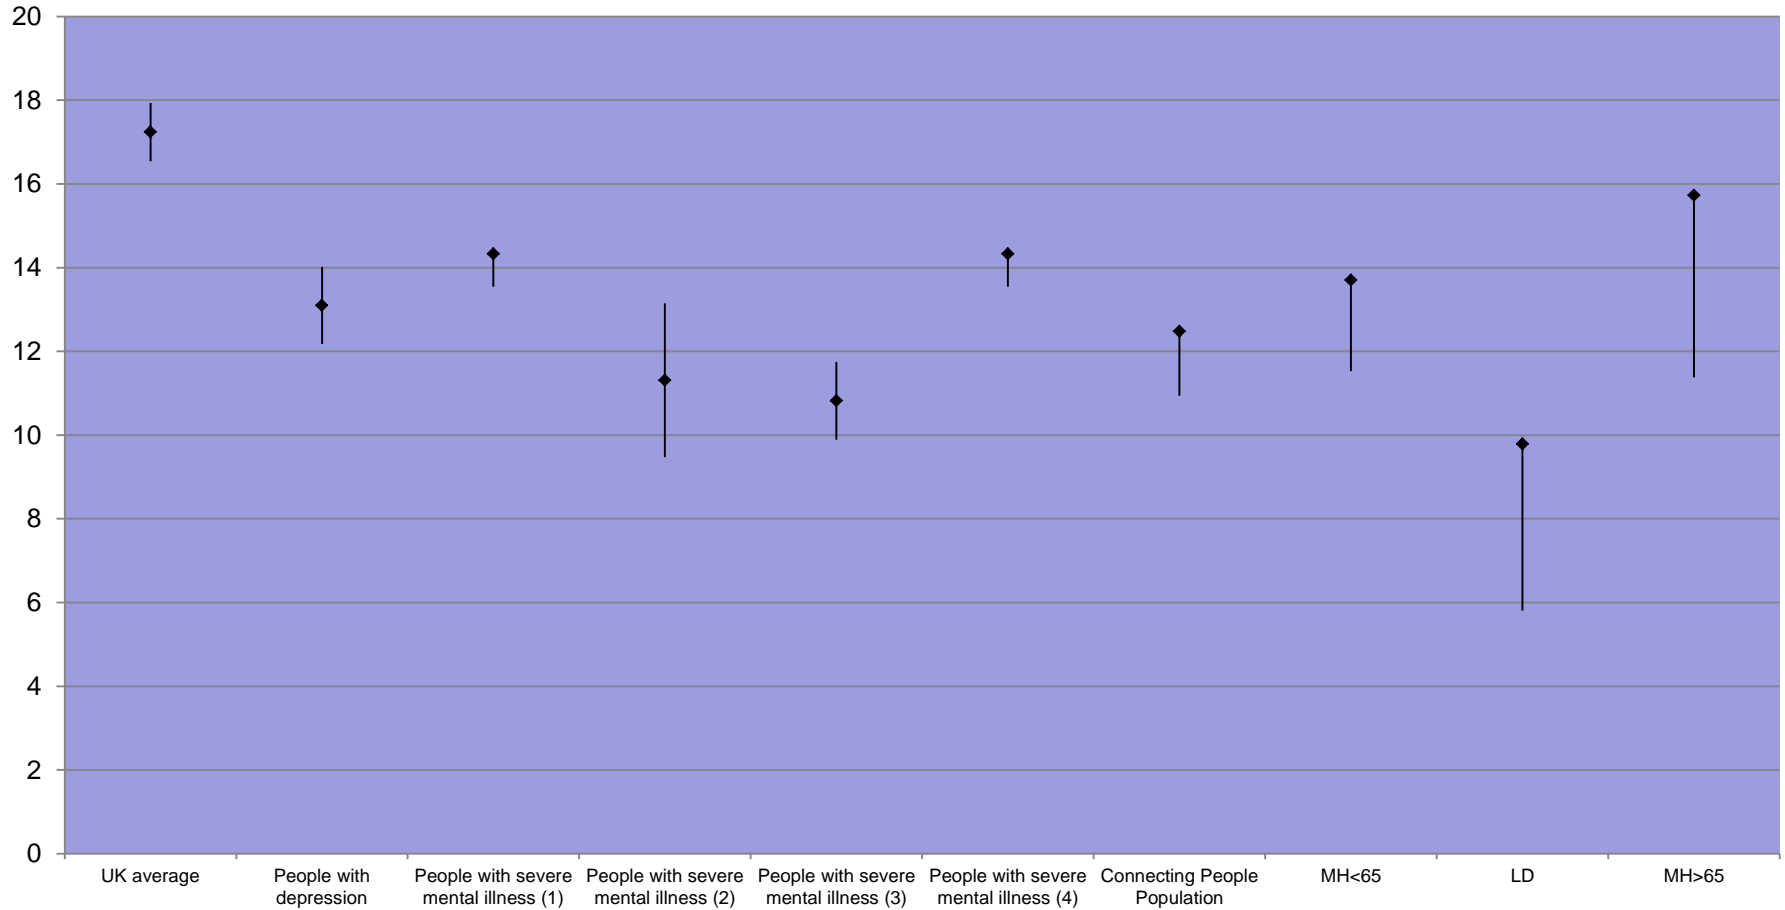

Multiple deprivation

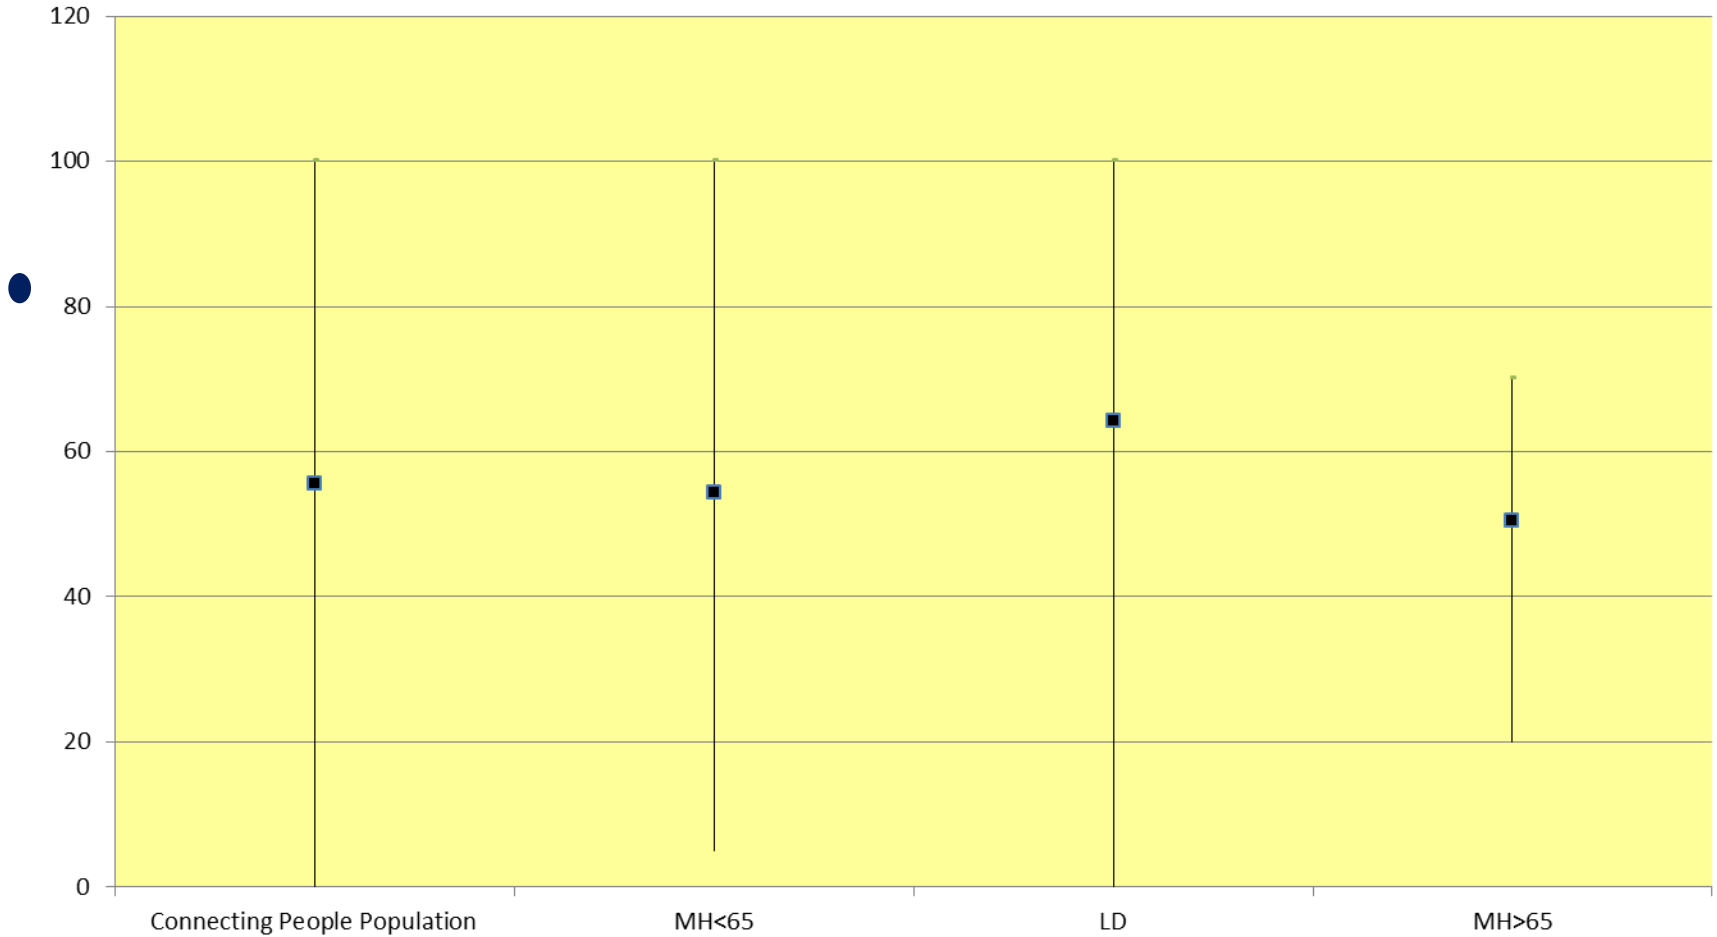

Access to social capital

Self-rated Health Score

- In the UK Mental health social work is largely defined by statutory functions – MHA Act, personalisation, safeguarding
- We have not fully exploited our therapeutic potential
- Evidence base for mental health services is defined by psychiatry and psychology through the dominant paradigm of the randomised controlled trial
- We need to provide better evidence about what we do well to influence NICE guidelines, local authorities and mental health services
- Complex social interventions can be modelled, articulated and evaluated
- Mental health social work and social care has the potential to shape its own destiny
